

# Lin Christenberry Marsh Garden Plant Varieties

The Lakeshore Park River Trail Woodland Marsh Enhancement Project began in 2017 with a vision to transform a densely vegetated area surrounding a planned boardwalk overlooking the Tennessee River into a special landscape experience that would highlight native plant species. Seasonally appropriate efforts have been made to remove invasive species while allowing desirable native plants to reproduce and emerge from the seed bank. These efforts have involved Lakeshore Park Conservancy in partnership with Gardner Monaco design as well as students from the University of Tennessee and citizens from the surrounding area.

This secluded Park experience is a showcase to demonstrate the ornamental potential of native plants in our area. Reduced invasive loads make it possible to successfully introduce new native species into the landscape to create a beautiful, biodiverse, resilient landscape with native plants. Since work on the Marsh began, thousands of native plants have been added, representing over 60 unique species.

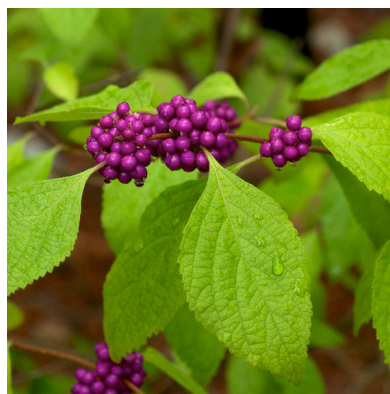

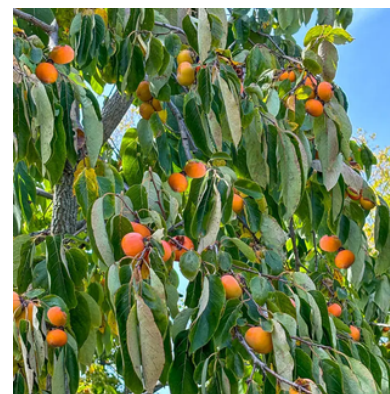

Allegheny  
Monkey Flower

American Alum Root

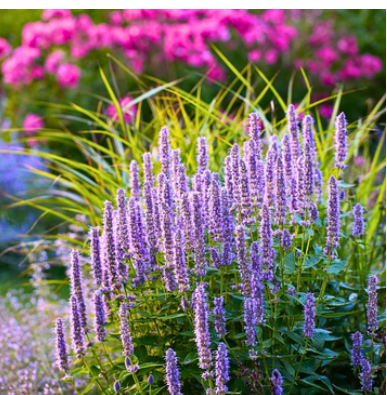

American  
Beautyberry

American  
Persimmon

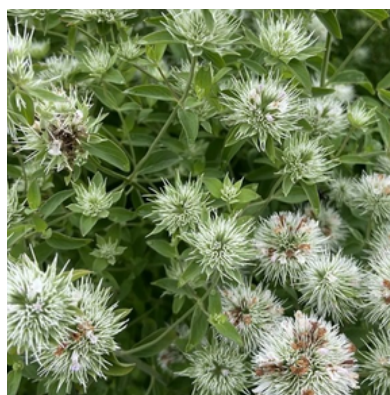

Americal  
Silverbell

Anise Hyssop

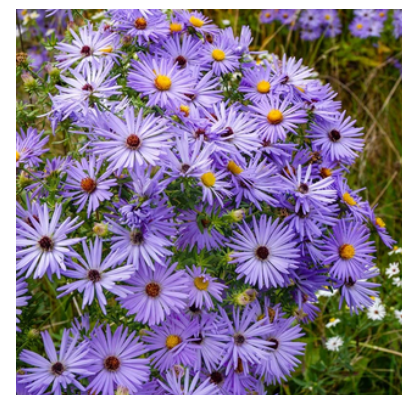

Appalachian  
Blazing Star
